**E.B.**

**Alzheimer's Disease is not senility, and it is not a normal part of the aging process. It is a disease. It can strike anyone.**

It is the most common cause of severe intellectual impairment in older people. Alzheimer's disease is a degenerative brain disease that causes progressive loss of memory and mental abilities. It is often accompanied by depression and personality change. The cause is unknown. The symptoms and rate of progression vary, but for most patients, the disease progresses slowly over a period of 5 to 10 years, or longer.

**Alzheimer's is irreversible and fatal. It may be diagnosed only by a physician and only after a thorough physical, psychological, and neurological evaluation.**

So if you know any one suffering from Alzheimer's or Dementia, take him to the Doctor for diagnosis or to the organisation who offer psycho socio care facilities.
